

FMS Sequencer 6 sec P51

Art.Nr.: PA-FMS-FMSSEQ6S-P51

FMS Sequencer-6 sec P51

Sequencer is a time system used to control RC airplane door and landing gear working in the proper order. Different sequencer has different effect. We have three different sequencers now. They are for different airplanes.

Sequencer-6 sec P51

The latency effect is 6 sec, specially designed for P51. The latency effect is same to real plane. When the doors open, the landing gear extends slowly. When the landing gear is completely off, doors will be closed again. The sequencer needs corresponding el retract which must play in less than 6 sec, or the wheel door shall close before landing gear back in the tank.

At present, the Sequencer-6 sec P51 could only be used at the following P51 range: 1400MM P-51B, 1400MM P-51D, 1700MM P-51D

All the above airplanes use dedicated FMS retract, specially designed for P51.

Warning: Please make sure that your retract (P51) is definitely FMS retract (5 sec) before purchasing this sequencer.

Collocations Recommend: Sequencer-6 sec P51 + FMS retract-5 sec
